OVERALL RISK SCORE
HIGH RISK

Top Red Flags

9

"Junior" role requiring 5+ years of experience

This is a direct contradiction; either the title or the requirement is wrong, suggesting the role is being mispriced to justify below-market pay for senior-level work.

8

Absurdly broad tech stack requirement

React, Angular, Vue, Node.js, Python, Java, Golang, AWS, Azure, GCP, Docker, Kubernetes, plus AI/ML. No single junior hire realistically has deep expertise across three frontend frameworks, four backend languages, and three cloud providers. Signals a poorly scoped role or an expectation to be a one-person department.

9

"24/7 support when needed"

A strong burnout indicator, especially paired with a junior title and a 12-person team. Usually means no formal on-call rotation or extra compensation exists.

8

Hustle-culture language ("work hard, play hard," "must thrive under pressure," "we are like a family")

"Like a family" is frequently used to guilt employees into unpaid overtime or discourage boundary-setting.

7

Hidden relocation clause

The role is listed as remote, but relocation to Bengaluru "may be required after probation." This undermines the remote claim and could blindside candidates who accept assuming full flexibility.

6

No salary range disclosed

Combined with vague seniority expectations, this makes it difficult to judge whether compensation matches the demanded skill set.

6

Company is 8 months old, 12 employees, no public funding info

Early-stage and financially unproven. Elevated risk of role instability, delayed pay, or sudden pivots and layoffs.

7

Employee reviews mention long working hours

Direct external corroboration of the burnout signals already present in the job description.

6

Mismatched seniority ("lead client meetings," "mentor junior developers") for a junior role

Suggests either a senior role mispriced as junior, or an inexperienced hire being set up to fail.

Positive Signals

- The listing has real structure (requirements, responsibilities, benefits) rather than a bare-bones single-line post.
- AI/ML is listed as "preferred" rather than mandatory, showing at least some flexibility in requirements.
- Remote work is offered as a baseline, even though it is later caveated with a relocation clause.

Risk Breakdown

Category	Risk Level
Requirements	High
Culture	High
Remote	Medium-High
Hiring	Medium-High
Company	Medium

Final Verdict

AVOID (or apply only with extreme caution and heavy negotiation)

The combination of a mistitled role, an unrealistic skill list, explicit 24/7 support expectations, hustle-culture language, and a young, financially unproven company with employee-corroborated long hours makes this a high-risk listing. If you still want to pursue it, use the interview to force clarity on the points below before accepting any offer.

5 Smart Interview Questions

- 1 The listing says "Junior" but requires 5+ years of experience — can you clarify the actual seniority level and how compensation is benchmarked against that?
- 2 With such a wide tech stack listed, which of these technologies will I actually be using day-to-day in the first 6 months, versus “nice to have”?
- 3 Can you walk me through what "24/7 support when needed" looks like in practice — is there an on-call rotation, compensation for after-hours work, and how often has this been invoked in the past 3 months?

- 4 The role is listed as remote with possible relocation to Bengaluru after probation — under what specific conditions would relocation be required, and is it optional or mandatory?
- 5 Since the company is 8 months old, could you share where you are in terms of funding runway, and what the team's growth or attrition has looked like since founding?
